

Welcome to the Age of Agile

DIG 123 – Agile Methodologies for Innovation (3 cr) · Class 1 of 15 · Sprint 0

Monday, September 21, 2026 · Lecture hour (60 minutes)

Lecture hour · four lessons, four activities · Cyber.SoHo Educational Hub

From the Industry to the Classroom — Building the IT's Future, Today and Together!

Educational material — © 2026 Cyber.SoHo. All rights reserved. Use is subject to the Cyber.SoHo Legal Notice, Terms of Use and Acceptable Use Policy (link on the last slide).

Required text: Denning, S. (2018). The Age of Agile: How Smart Companies Are Transforming the Way Work Gets Done. AMACOM.

Today's 60 minutes

Class 1 · Sep 21, 2026

- 0:00 Check-in (2 min) — attendance in Blackboard, phones out
- 0:02 Lesson 1 · Welcome and the rhythm (8 min) → pair ice-breaker (5)
- 0:15 Lesson 2 · What is a methodology? (10) → the spectrum line (5)
- 0:30 Lesson 3 · Agile in ten minutes (10) → fun-quiz ×3 (5)
- 0:45 Lesson 4 · The Integrative Mini-Project (10) → zen-break + card (5)
- 1:00 Team Studio (120 min) · then the Home Sprint (120 min)

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

By the end of this hour you can

1. Describe how this course runs every Monday (the 1:2:2 rhythm) and where its resources live
 2. Define work methodology and tell a predictive way of working from an adaptive one
 3. Explain iteration, increment and feedback loop, and name Denning's three laws
 4. Describe the Integrative Mini-Project ("the Portfolio"), the ladder D1–D11 and the on-time rule
- Syllabus alignment: Learning Outcome 1 — understand the concept and utility of Agile methodologies in business applications
 - Required text: Denning, S. (2018). The Age of Agile. AMACOM — free in VitalSource

Lesson 1 · Welcome and the rhythm

0:02 – 0:10 · then 🤝 pair ice-breaker (5 min)

Who is in the room, what this course is, how every Monday runs — and why the clock, not the work, decides when a block ends.

✓	L1	act	L2	act	L3	act	L4	act
---	----	-----	----	-----	----	-----	----	-----

0:00 · the 60-minute plan · 1:00 — the rust blocks are this lesson and its activity

Who is in the room, and what this course is

- Attendance: recorded at minute 0 of every session and at the end of every Team Studio
- Your professor: about 25 years in the IT (Information Technology) industry — tools rarely decided success; the methodology did
- The course in one line: fifteen Mondays, one product
- DIG 123: three credits, no prerequisite, no coding required (a low-fidelity prototype is enough — coding is welcome)
- Four learning outcomes: Agile in business · Design Thinking · the foundations of Scrum · apply the methods to all your program work
- The order of the semester: Agile mindset → Scrum → user stories & estimation → Kanban & flow → digital business → Design Thinking → Business Model Canvas → case studies

Three words we use every week (1/2)

Lesson 1 · 0:02–0:10

Methodology

A documented, repeatable set of principles, roles, practices and artifacts that a group follows to plan, decide, deliver and learn.

Lesson 2 takes this definition apart piece by piece.

Agile (capital A)

A family of methodologies that deliver work in small, usable pieces, obtain feedback from real users early and often, and change the plan because of that feedback.

The name comes from the Manifesto for Agile Software Development — February 2001, seventeen practitioners. You read it next week.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Three words we use every week (2/2)

- **Innovation** — OECD (Organisation for Economic Co-operation and Development), Oslo Manual:
 - a new or improved product or process that differs significantly from what existed before
 - **and** that has been made available to potential users
- The last clause is the one that matters for us:
 - an idea that never reaches a user is not yet an innovation
 - → your project is built for users you can actually reach

How every Monday runs — the 1:2:2 rhythm

One Monday of DIG 123 — the 1:2:2 rhythm as time-boxes

Every block has a fixed length. When the clock says so, the block closes; unfinished work is carried into the next planning.

1 h · Lecture hour — 60 minutes, four lessons, four activities

2 h · Team Studio — a mini-sprint on your own product

2 h · Home Sprint — finish, read, reflect, submit

Deadline: Sunday 23:59 on Blackboard — keep your own copy

1 h lecture · 2 h Team Studio in class · 2 h Home Sprint at home — the same rhythm every week, so by Class 3 you run the studio yourselves.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

The lecture hour: four beats

- Minute 0 — a two-minute check-in (attendance)
- Then four short lessons — the schedule calls them **Beats**: about 10 minutes of the professor, then 5 minutes of you
- The 5 minutes are always an activity that earns **In-class activity points**: a pair exercise, a drawing, flashcards, a fun-quiz on your phone, or a zen-break
- No beat runs longer than 15 minutes — attention is a limited resource
- Class 6 applies the same principle to work itself: the WIP (Work In Progress) limit

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

The Team Studio: a mini-sprint every week

- Planning — 10 min: the studio goal, who does what
- Build — about 80 min: the exercise, research or assignment of the week, on YOUR product
- **Sprint Review** — 20 min: show your work to another team or the class; collect feedback
- **Retrospective** — 10 min: how did we work? one thing to change
- Roles rotate: before the Mid-Term every member is Product Owner once and Scrum Master once (roles defined in Class 3)

The Home Sprint and the Learning Log

- Two hours between Monday and Sunday
- Finish what the studio started → the week's **Deliverable**
- Do the reading: one Denning chapter or a free guide most weeks
- Write your individual **Learning LOG** — five lines:
 - what I did · what I learned · what surprised me · one question · one thing to apply next week
- Submit everything on Blackboard by **Sunday 23:59**
- Keep your own copy of every team artifact (Lesson 4 explains why)

The time-box

- A **Time-box** is a fixed, maximum duration allocated to an activity in advance
- When the time is up, the activity stops — finished or not
- Unfinished work is not hidden and not squeezed into overtime: it is written down and carried into the next planning
- Why time-boxes work — two documented facts:
 - 1. Without a limit, an activity expands to fill the time available (C. Northcote Parkinson, 1955)
 - 2. A fixed cadence makes progress measurable: this week versus last week
- In Scrum every event is a time-box: the Sprint (one month or less), the Daily Scrum (15 minutes)
- Today: when the timer rings, the professor stops — that is the lesson, not rudeness

Where things live — set these up this week

Lesson 1 · 0:02–0:10

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Activity · Pair ice-breaker (5 min)

0:10 – 0:15 · earns activity points

- Learn Agile by living Agile: the rhythm you just heard IS an Agile methodology applied to a class
- In pairs — two minutes each way:
 - your name · your program · "the one app or service I would love to fix, and why"
- Then five volunteers share their partner's answer in one sentence
- Watch after class (each under 15 min, verified links — check them with VirusTotal first):
 - **Video:** [Intro to Agile under 5 minutes](https://youtube.com/watch?v=N2hDKpgzdIE) youtube.com/watch?v=N2hDKpgzdIE
 - **Video:** [What is Timeboxing? | Scrum Methodology](https://youtube.com/watch?v=kZYjchCf68s) youtube.com/watch?v=kZYjchCf68s

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Real-life example 1 · One Monday, time-boxed

Lesson 1 · 0:02–0:10

- Team Locker (a campus-locker booking page) lives its first Monday as 14 time-boxes
- The clock advances minute by minute; a block closes when the clock says so
- Unfinished work carries over — into the next block, or into next week's backlog, never into overtime
- Returns in the labs: D1 working agreements · D4 Sprint 1 Kit (time-boxed events) · D6 Flow Pack (carried-over work = WIP)
- Run it yourself in the lecture page: Start / Pause · Next step · Restart · Copy the code

Team Locker — one Monday, 300 minutes in 14 time-boxes

Live simulation in the lecture page (Start / Pause · Next step · Restart · Copy)

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Lesson 1 in five cards

Lesson 1 · 0:02–0:10

The 1:2:2 rhythm?

1 h lecture (4 × 10-min lessons + 5-min activities)
· 2 h Team Studio · 2 h Home Sprint — every week

A time-box?

fixed maximum duration set in advance; when it ends the activity stops; unfinished work is carried into the next planning

The four studio blocks?

Planning 10 · Build ~80 · Sprint Review 20 · Retrospective 10

The Learning Log?

five lines, individual, on Blackboard by Sunday 23:59 with the deliverable

The four free resources?

Schiller One · VitalSource · Digital Learning Resource Center (EBSCO) · tutor.com

In the lecture page these are click-to-flip flash-cards; the answers are on their backs.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Lesson 2 · What is a methodology?

0:15 – 0:25 · then  visualization: the spectrum line (5 min)

The definition, piece by piece; why organizations need one; method → culture → results; predictive versus adaptive.

✓	L1	act	L2	act	L3	act	L4	act
---	----	-----	----	-----	----	-----	----	-----

0:00 · the 60-minute plan · 1:00 — the rust blocks are this lesson and its activity

The definition, piece by piece

- A **Methodology** = documented + repeatable + principles + roles + practices + artifacts
- **Documented** — written down: a new member can read it; a team can be held to it
- **Repeatable** — used the same way on the next piece of work → results become comparable
- **Principles** — the reasons behind the rules ("deliver working product frequently")
- **Roles** — who decides what: who orders the work, who does it, who removes obstacles
- **Practices** — the activities performed regularly: a planning meeting, a review, a daily check
- **Artifacts** — what the work produces and keeps: a plan, a list of requirements, a working product, a report
- Four verbs every methodology must cover: plan · decide · deliver · **Learn**
- If one is missing — usually learn — you have a procedure, not a methodology

Four neighbours that are not a methodology

Lesson 2 · 0:15–0:25

Method — a single technique (for example, one way of estimating effort)

Process — an ordered sequence of activities with inputs and outputs

Framework — a deliberately minimal structure (a few roles, events, artifacts) that leaves techniques open — the Scrum Guide calls Scrum a framework for exactly this reason

Tool — software or equipment used inside a methodology: a board, a spreadsheet, a chat channel. Change the tool and keep the methodology; the reverse is far more expensive

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Why an organization needs one — four measurable reasons

- **Consistency** — the same inputs, treated the same way, give a predictable quality of output; the basis of any promise to a customer
- **Coordination** — a shared vocabulary and agreed hand-offs let people who do not sit together work on one product; whoever joins in week ten can read the artifacts of week one
- **Learning** — because the practice is repeatable, its results can be measured, compared and improved; you cannot improve what you do differently every time
- **Accountability** — roles make it clear who decided what, which protects people as much as the product

Method → culture → results

- A methodology decides which behaviours are rewarded and which are penalized
- Reward following the original plan → people defend the plan even when new facts contradict it
- Reward showing working product to users every two weeks → people talk to users
- Repeated behaviours shared by a group = a **Culture**: assumptions and habits nobody questions any more
- A culture produces its results as reliably as a machine produces its output
- So the method decides what employees experience every day, what the customer receives and when, and what the **Stakeholders** — owners, managers, regulators, partners — are told and when
- A hotel group adds online check-in: front-desk staff consulted after launch (one method) or trying a rough version in week two (another). Same product, same people — different result

Predictive (plan-driven) — and the Waterfall model

- Every methodology sits on one axis; PMI (Project Management Institute) names its ends in the Agile Practice Guide
- **Predictive:** requirements, schedule and budget fixed as early as possible, then execute the plan
- Change goes through **Change control:** formal request → impact analysis → approval
- Delivery happens mostly at the end
- **Waterfall** (Winston Royce, 1970): requirements → design → implementation → verification → maintenance, each phase completed before the next
- Royce himself warned that a single pass was risky and the design should be tried and revised at least once
- Right choice when requirements are stable and the technology known: a bridge, a regulatory filing, the wiring of a building

Adaptive (change-driven) — and hybrid

- **Adaptive** assumes the requirements **WILL** change: neither users nor team can know everything at the start
- Work is delivered in short cycles; a usable result appears at the end of each; users see it; the next cycle's plan is adjusted
- Time and cost are fixed per cycle — the **Scope** (what the product will do) is what flexes
- Agile methodologies, including Scrum and Kanban, are adaptive
- **Hybrid** combines both: a predictive plan for the building, an adaptive one for the software inside it

The deciding variable: uncertainty

Same product, same effort — when do real users see it?

The laundry-room page built two ways. ★ = real users try the product · hatched = rework after the week-6 change.

Low uncertainty → planning early is cheap and correct. High uncertainty → an early plan is a guess in confident language; every week before the first user contact is a week of risk. Predictive is not a synonym for wrong — choosing deliberately is.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Activity · Visualization: the spectrum line (5 min)

0:25 – 0:30 · earns activity points

- One line on the board: "plan everything first" (predictive) $\leftrightarrow$ "learn as you go" (adaptive)
- Place a sticky note for three projects you know: a school project, a video-game release, a rocket launch
- Two students explain a surprise — the argument is always about uncertainty and the cost of change
- Watch after class (each under 15 min, verified links — check them with VirusTotal first):
 - **Video:** [Waterfall vs Agile vs Hybrid Approaches Explained in 10 Minutes!](https://www.youtube.com/watch?v=qf0Yzrzr_i4) [youtube.com/watch?v=qf0Yzrzr_i4](https://www.youtube.com/watch?v=qf0Yzrzr_i4)
 - **Video:** [Agile in under 3 minutes](https://www.youtube.com/watch?v=Yg1HpmmKcd4) [youtube.com/watch?v=Yg1HpmmKcd4](https://www.youtube.com/watch?v=Yg1HpmmKcd4)

Real-life example 2 · Two teams, one product, fourteen weeks

Lesson 2 · 0:15–0:25

- The laundry-room page for 300 residents — built by a predictive team (P) and an adaptive team (A)
- Week 6: the residence installs new machines with a different API (Application Programming Interface)
- Team P: 1 user contact · first usable result week 14 · 2 weeks of rework, release slipped
- Team A: 7 user contacts · first usable result week 2 · half a week of rework
- Returns in the labs: D2 Product Vision Board (Waterfall-vs-Agile plan comparison) · D5 Sprint 1 burndown

Live simulation in the lecture page (Start / Pause · Next step · Restart · Copy)

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Lesson 2 in five cards

Lesson 2 · 0:15–0:25

A work methodology?

documented, repeatable principles + roles + practices + artifacts, covering plan, decide, deliver and learn

Is Scrum a methodology, method, process, framework or tool?

a framework — the Scrum Guide's own word

Predictive?

requirements, schedule, budget fixed early; change control; delivery at the end; best when uncertainty is low

Adaptive?

short cycles, a usable result each cycle, plan adjusted from feedback; time and cost fixed, scope flexes

Method → culture → results?

the method rewards behaviours; repeated behaviours become a culture; the culture produces the results

In the lecture page these are click-to-flip flash-cards; the answers are on their backs.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Lesson 3 · Agile in ten minutes

0:30 – 0:40 · then  fun-quiz ×3, hands up (5 min)

Iterations and increments, the feedback loop, the Sprint as the container, and the three laws Denning found in every Agile organization.

✓	L1	act	L2	act	L3	act	L4	act
---	----	-----	----	-----	----	-----	----	-----

0:00 · the 60-minute plan · 1:00 — the rust blocks are this lesson and its activity

Agile: three mechanisms and a Manifesto

Lesson 3 · 0:30–0:40

- **Agile**, in this course: a family of adaptive methodologies built on three mechanisms
 - 1. work is delivered in small, usable pieces
 - 2. real users see those pieces early and often
 - 3. the plan is changed on the basis of what those users do and say
- The Manifesto for Agile Software Development — February 2001, Snowbird, Utah, seventeen practitioners
 - four values, twelve principles, one page — on agilemanifesto.org; you read it next week
- Today we need only the mechanisms and their vocabulary

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Iteration and Sprint — one cycle, repeated

Lesson 3 · 0:30–0:40

One iteration, repeated — and the increment it leaves behind

Plan → build → review → adapt. Each cycle adds a usable, additive increment; each review changes the backlog.

feedback loop: deliver → observe → learn → adjust

The product in users' hands after each Sprint

An **iteration** is one short, fixed cycle: plan a little → build → review with users → adapt the plan. Its length is a time-box — two weeks in most teams, never more than a month. In Scrum the iteration is called a **Sprint**. Many chances to be wrong cheaply, instead of one chance to be wrong expensively.

Increment: usable and additive

- An **Increment** is the usable result produced by an iteration
- **Usable** — a real person can do something with it: read the list, place the order, book the locker
 - a slide deck about a feature is not an increment; a rough but working version of the feature is
- **Additive** — each increment is added to all previous ones and verified to work with them
 - the product grows week by week and is, at every moment, in a state that could be shown
- Your Portfolio grows exactly like this: D1 is its first increment, D2 the second...

The feedback loop and the backlog

- A **Feedback loop**: deliver → observe real use → learn → adjust the plan
- The shorter the loop, the cheaper the lesson
- Barry Boehm's studies (1970s–1980s): the cost of correcting a wrong decision rises steeply the later it is discovered
 - a misunderstanding found in week two costs far less than the same one found in week twelve
- Early feedback is the cheapest risk reduction a team can buy
- The **Backlog**: the single, ordered list of everything the product may need — most valuable item on top
- Each iteration takes from the top; each review adds, removes or re-orders
- The backlog is never finished — it is a plan that is allowed to learn

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Two inspections — and one misconception

Sprint Review — inspects the **Product**: the increment is shown to users and stakeholders; what they say changes the backlog

Sprint Retrospective — inspects the **team** and its **process**: what worked, what did not, one thing to change next iteration

You practise both every Monday, in the Team Studio, on your own product

"Agile means no planning" — **False**

Agile teams plan continuously and in smaller pieces: at the start of every iteration, at every review, at every daily check

What they refuse to do is pretend that a plan made before the first user contact is knowledge

Planning is not reduced — it is redistributed to the moments when the team knows the most

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

A two-week Sprint for a student team

- Monday, week 1 — 30-minute planning: pick three backlog items; write the **Sprint Goal** in one sentence
 - "a student can see which lockers are free and reserve one"
- The two weeks — build; every day a three-line message: done yesterday · planned today · blocked by
- Friday, week 2 — five students from another program try the page for ten minutes; the team watches and takes notes = the Review
- Thirty minutes later — the team alone: what slowed us down? what will we change? = the Retrospective
- Monday, week 3 — the next planning starts from a backlog the review has changed
- Nothing in this cycle needs a manager's permission; nothing waits for the end of the semester

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Denning's three laws — named today, detailed next week

Lesson 3 · 0:30–0:40

- Stephen Denning studied organizations that adopted Agile far beyond software teams — a bank, a telecom manufacturer, a health-information company, a game studio, a global software firm — and asked what they had in common
- **The Law of the Small Team** — big problems split into small batches for small, autonomous, cross-functional teams in short cycles (about ten people or fewer) — Chapter 2
- **The Law of the Customer** — every decision (what to build, in what order, what "done" means) is measured against the value it creates for the customer — Chapter 3
- **The Law of the Network** — the organization works as a network of teams that share information and coordinate directly, not a hierarchy where information travels up and back down — Chapter 4
- Cross-functional = every skill needed to finish an increment, without waiting on another department · Autonomous = the team decides how to do its work

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

You are already inside all three

- Your team of four = a small team
- The users you can reach — students, a club, a small business, your family = your customer
- The class, with teams reviewing each other every Monday = the network
- "Learn Agile by living Agile": the course is not a description of the method; it is an instance of it
- Two facts to place Agile correctly:
 - born in software, but general — any work with uncertain requirements and a high cost of change: marketing, hospitality, curricula, research
 - not one method but a family: **Scrum** (roles, events, artifacts in Sprints), **Kanban** (visualize, limit WIP, manage flow), **Lean**, **DevOps** — one-line definitions in Denning's Box 1-2

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Activity · Fun-quiz ×3 — hands up (5 min)

Lesson 3 · 0:30–0:40

1. Which is more Agile: one full application in twelve months, or a usable slice every two weeks?

2. Who should see the product first — the boss, or a real user?

3. True or false: Agile means no planning

- Taking part earns the activity points — the score is never graded
- Watch after class (each under 15 min, verified links — check them with VirusTotal first):

- **Video:** [Scrum in under 5 minutes](https://www.youtube.com/watch?v=2Vt7Ik8Ublw) [youtube.com/watch?v=2Vt7Ik8Ublw](https://www.youtube.com/watch?v=2Vt7Ik8Ublw)
- **Video:** [Spotify Engineering Culture \(Part 1\)](https://www.youtube.com/watch?v=Yvfz4HGtoPc) [youtube.com/watch?v=Yvfz4HGtoPc](https://www.youtube.com/watch?v=Yvfz4HGtoPc)

0:40 – 0:45 · earns activity points

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Real-life example 3 · Five Sprints for the café pre-order page

- A team builds an online pre-order page for the campus café — 40 students who buy coffee between classes
- Backlog of 12 features with a value and a size; capacity 20 points per two-week Sprint
- Every Sprint: plan → build → review with five real users → adapt the backlog
- Feedback adds "pay with student card" and "split the bill"; "loyalty points" sinks to the end
- Value in users' hands: 26 → 52 → 67 → 78 → 80, versus 66 for the plan delivered once at week 10
- Returns in the labs: D4 Product Backlog & Sprint Goal · D5 story points & velocity · every Monday's Sprint Review

Live simulation in the lecture page (Start / Pause · Next step · Restart · Copy)

Lesson 3 in five cards

Lesson 3 · 0:30–0:40

An iteration, and its Scrum name?

one short fixed cycle plan → build → review → adapt, one month or less — a Sprint

The two properties of an increment?

usable, and additive (added to all previous increments and verified with them)

A feedback loop?

deliver → observe real use → learn → adjust; shorter loops make wrong decisions cheaper

Review versus Retrospective?

Review inspects the product with users;
Retrospective inspects the team and its process

Denning's three laws?

Small Team · Customer · Network

In the lecture page these are click-to-flip flash-cards; the answers are on their backs.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Lesson 4 · The Integrative Mini-Project — "the Portfolio"

0:45 – 0:55 · then 🧘 zen-break + commitment card (5 min)

One product, one team, one growing portfolio; the ladder D1–D11; how the Mid-Term sits inside it; the on-time rule; how the grade is built.

✓	L1	act	L2	act	L3	act	L4	act
---	----	-----	----	-----	----	-----	----	-----

0:00 · the 60-minute plan · 1:00 — the rust blocks are this lesson and its activity

The Portfolio: what you build

- A digital product or service for real users you can actually reach: students, a club, a small business, your family, a community group
- From a first idea to a tested low-fidelity **Prototype** (rough, cheap, built to answer a question) with a **Business model**
- Using the methods of the course in the order you learn them:
 - Agile mindset → Scrum → user stories & estimation → Kanban & flow → digital-business framing → Design Thinking → Business Model Canvas → case-study reasoning
- Nothing you do this semester is a throw-away exercise
- Each week's Team Studio + Home Sprint = one **Increment** of the Portfolio = one **Deliverable**, D1 to D11 (team artifact + each member's Learning Log)

The deliverable ladder — the Mid-Term basis (1/2)

- D1 · Team Charter & Product Idea Card — team, roles rotation, working agreements, idea, users, problem, three reasons Agile fits — due Sun Sep 27
- D2 · Product Vision Board — vision, users and needs, first three increments, Manifesto map, Waterfall-vs-Agile plan — due Oct 4
- D3 · Scrum Team Charter + Scrum history — role cards, rotation table, empiricism plan, values pledge — due Oct 11
- D4 · Sprint 1 Kit — Product Backlog, Sprint Goal, Sprint Backlog, Definition of Done, Daily Scrum log — due Oct 18 (Sprint 1 starts Oct 12)
- D5 · User Story Set — acceptance criteria, story points, release forecast, Sprint 1 burndown, Review & Retro notes — due Oct 25
- D6 · Flow Pack — Kanban board with WIP (Work In Progress) limits, lead and cycle times, throughput, Little's Law, decision memo — due Nov 1
- D7 · Digital Business & Innovation Brief — org/product/service map, the 3E's (Empower, Experiment, Evolve), an MVP (Minimum Viable Product) hypothesis, Business Model Canvas v0 — due Nov 8 → Mid-Term basis complete

The deliverable ladder — D8 to D11 and Portfolio v1.0 (2/2)

Three Design Thinking Studio Weeks produce D8 (kickoff), D9 (Empathize & Define), D10 (Ideate & Prototype), D11 (Test & Iterate + a full case). On December 20 — before the break — everything is assembled into Portfolio v1.0 with a one-page "what we would do differently" and a 300-word individual reflection.

How the Mid-Term sits inside the Portfolio

- Monday, November 16 — the Mid-Term Assessment (30%): an individual "Agile Foundations Report for my product", written in class, 120 minutes
- Four parts: Agile & Scrum applied to your product · backlog craft · a flow computation · digital business & innovation
- Written FROM your own submitted D1–D7 — bring them printed or as a PDF (Portable Document Format) file, plus a calculator; no internet, no other team's work
- Class 8 (Nov 9): Mid-Term Review + **Portfolio Audit** — piece by piece, D1–D7 complete, consistent, in your own folder
- Final Exam, January 18 (40%): comprehensive, computational and application-based, 2 hours, Respondus LockDown Browser — numbers of the same shape as the ones you produced for your own product

The on-time rule — read this twice

- Every deliverable is due **Sunday 23:59** before the next class
- Each piece counts three times: continuous assessment · Mid-Term basis · Final study base
- All of D1–D7 must be on Blackboard by Sunday, November 8
- A missing piece = writing that part of the Mid-Term from memory
- Late: –10% per day, up to three days; after that the piece scores 0 — but you must still submit it: it is your basis
- Keep your own copy of every team artifact — on November 16 the copy in your hands is the only one that counts

How the grade is built

Lesson 4 · 0:45–0:55

- Syllabus: Continuous Course Assessments 30% · Mid-Term 30% · Final 40%
- Inside the 30% of continuous assessment:
 - D1–D11, adjusted by your individual Learning Log — 16%
 - Portfolio v1.0 — 6%
 - Checkpoint Quizzes CQ1 (Oct 5) + CQ2 (Oct 26), 15 min each in class — 4%
 - In-class activity points (beat activities, reviews, retros) — 4%: earned by being here and taking part, never a quiz score
- Many small assessments: no continuous piece above 6%, so one bad week never sinks you — but a missing week always costs, and it is visible early enough for help to reach you

Where the 100% comes from

Formative, summative, rubric — and your own work

- **Formative** assessment — information while there is still time to act on it: fun-quizzes, flashcards, the self-checks in the lecture page — none counts against your grade
- **Summative** assessment — measures learning at a fixed point: Checkpoint Quizzes, the Mid-Term, the Final
- **Rubric** — the published table of criteria and marks for a piece; posted on Blackboard with every deliverable, so you know what "good" means before you start
- Work submitted for evaluation must be your own, produced according to each assessment's instructions — including the rules on collaboration and on automated tools
- The Mid-Term report is collected through a Blackboard assignment with SafeAssign (the university's similarity-checking service) turned on
- Full terms: Cyber.SoHo Legal Notice, section 18 — Academic integrity

Activity · Zen-break + commitment card (5 min)

0:55 – 1:00 · earns activity points

- Sixty seconds of silence and breathing — no talking, no phones (attention is a resource; we have used 55 minutes of it)
- Then one sentence on a card: "To submit on time every week, I will..."
 - one concrete action: a Saturday calendar alarm · a Sunday 18:00 team check · a personal copy folder created today
- Keep the card in your folder — you will read it again on November 9
- Watch after class (each under 15 min, verified links — check them with VirusTotal first):

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Real-life example 4 · The deliverable ladder tracker

Lesson 4 · 0:45–0:55

- Team Locker submits D1–D7 over seven Sundays: on time, one day late, three days late, five days late — or not at all
- The on-time rule is applied piece by piece; a basis gauge counts what the team will hold on November 16
- Late but submitted: marks lost, basis kept (D7 at 0% still lets Part D be written from the portfolio)
- Missing: marks lost AND basis lost (no D6 → Part C written from memory)
- Returns in the labs: every Home Sprint D1–D7 · Class 8 Portfolio Audit · D6 lead-time table

The deliverable ladder — D1 to D7

D7 · Digital Business & Innovat	late, zero marks (0%)
D6 · Flow Pack	missing
D5 · User Story Set + release f	late, marks kept (70%)
D4 · Sprint 1 Kit	on time
D3 · Scrum Team Charter + histo	late, marks kept (90%)
D2 · Product Vision Board	on time
D1 · Team Charter & Product Ide	on time

Calendar — Sundays 23:59

09-27	10-04	10-11	10-18	10-25	11-01	11-08
-------	-------	-------	-------	-------	-------	-------

Mid-Term basis

6 of 7 pieces in your own hands

green = on time · amber = late, marks kept · rust =

Live simulation in the lecture page (Start / Pause · Next step · Restart · Copy)

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

Lesson 4 in five cards

Lesson 4 · 0:45–0:55

The Portfolio ends in?

Portfolio v1.0 on December 20: D1–D11 assembled + reflections

The Mid-Term basis?

your own submitted D1–D7, all in by Sunday, November 8

The on-time rule?

Sunday 23:59; counts three times; –10%/day up to three days, then 0 but still submit; keep your copy

The 30% of continuous assessment?

D1–D11 16% · Portfolio 6% · CQ1+CQ2 4% · activity points 4%

Formative versus summative?

formative = never graded (fun-quiz, flashcards);
summative = graded at a fixed point (CQ, Mid-Term, Final)

In the lecture page these are click-to-flip flash-cards; the answers are on their backs.

0:00 · the 60-minute plan · 1:00 — the rust block is where we are

After the hour — Team Studio, Home Sprint and D1

- **Team Studio** (120 min): intake card + teams of four (15) · working agreements (30) · idea pitches, dot-vote, one idea + one back-up (45) · Sprint Review: 60-second pitches, one question each (20) · retrospective-lite (10)
- **Home Sprint** (120 min): read Denning — Foreword, Introduction, Chapter 1 incl. Box 1-1 (Manifesto) and Box 1-2 (glossary) · finish D1 · pick your free tools and create a To do / Doing / Done board · Learning Log
- **D1 — Team Charter & Product Idea Card**, one page: team name and members, roles rotation plan, working agreements, product idea, target users, the problem it solves, three reasons Agile fits it
- **DUE Sunday, September 27, 23:59** on Blackboard — specification and rubric posted there
- Next Monday, Class 2: From Waterfall to Agile — the Manifesto and the mindset
